Claims:

Claim 1 -- (Currently Amended) In a packet data communication system, a header compression method comprising the steps of:

providing by a transmitting unit a Van Jacobson TCP/IP compressor/decompressor; determining whether a data packet is a first data packet of a call;

<u>if the data packet is the first data packet of a call</u>, generating by the transmitting unit a new TCP header;

if the data packet is not the first packet, concatenating by the transmitting unit a compressed RTP header and a compressed UDP header with the TCP header; and sending by the transmitting unit the new TCP header to/from the Van Jacobson compressor/decompressor as a unidirectional data transfer. --

Claim 22 (Canceled)

Claim 23 -- (Currently Amended) In a packet data communication system, a header compression method as claimed in claim 1, wherein there is further included steps of determining by a packet data service node whether a data packet is a first data packet of a call being performed by a packet data service node; and

if the data packet is not the first data packet performing steps of: receiving by the packet data service node an uncompressed TCP/IP

header; and

sending by the packet data service node the new TCP/IP header.--

Claim 24, line 6, delete "new"

Claim 25 -- (Currently Amended) In a packet data communication system, a header compression method as claimed in claim 1, wherein there is further included steps of: determining by a packet data service node whether a data packet is a first data packet of a call being determined by a packet data service node; and if the data packet is not the first data packet performing steps of:

receiving by the packet data service node the new TCP/IP header; and regenerating by the packet data service node an uncompressed TCP/IP header.

Claims 27-29 (Canceled)

Conclusion

 The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Yoshimura et all disclose (US 2001/0048680 A1) a network including a transmitter and a receiver in which a transmitter converts a non-compressed packet to be transmitted into a fullheader packet including a full header or a header-compressed packet including a compressed header, and sends the converted packet to the receiver, the transmitter sends at least important Application/Control Number: 10/625,296

packet in the non-compressed packet to be transmitted as a full-header packet. The important packet is a packet containing the data serving an important role when the data terminal eventually receiving each packet reproduces the audio and/or image in accordance with the data in each of the packet

Loa (US 6,314,095 B1) discloses a packet skimmer routes the RTP packets to the header compression engine and routes non-RTP packets back to the IP network unchanged. The header compression engine receives the RTP packet from the packet skimmer and compresses the IP/UDP/RTP header based on an RTP header compression algorithm defined by an Internet Engineering Task Force (IETF) standard, which is well known in the art. The payload of the RTP packet is then appended to the compressed IP/UDP/RTP header to form a compressed RTP packet. The header compression engine transmits the compressed RTP packet to the MPLS proxy engine. The MPLS proxy engine receives the compressed RTP packet from the header compression engine and creates the MPLS virtual circuit to the intended header decompression unit using the MPLS protocol defined by the IETF standard (or looks for the pre-established MPLS virtual circuit). The MPLS proxy engine appends a MPLS header to the compressed RTP packet (now called a MPLS packet) and transmits the MPLS packet to the IP network.
